

Evaluating Triage Nurse Competency in the Emergency Department

Brandon James Romero, RN, BSN

NURS 560 Concepts of Nursing Leadership

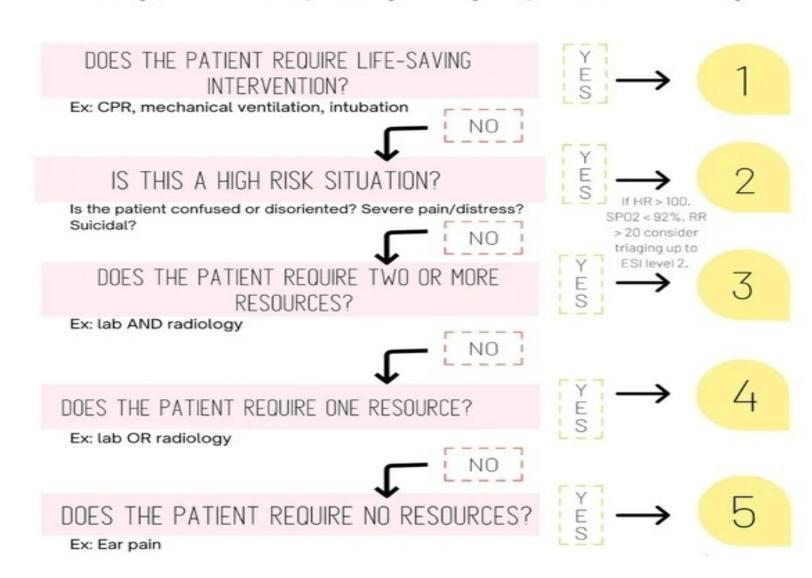

Dr. Kimberly Dunker, DNP, MSN, RN, CNE, CNEcl

BACKGROUND

- Triage is a process nurses use to safely organize patient care and flow when supplies and space are limited
- In an emergency department, this process is initiated by a registered nurse determining which patients need care first and where to place them to ensure safety
- ➤ Since 1999, the most common triage system used in US emergency departments is the Emergency Severity Index triage system

EMERGENCY SEVERITY INDEX

Determining patient acuity during Emergency Department triage

PROBLEM & SIGNIFICANCE TO NURSING

- ➤ Under and over-triaging patients have been shown in multiple studies to directly correlate with increased mortality rates, increased risk of patient safety, delayed care, increased length of patient stay, and increased costs (Sax, 2023)
- ➤ Patient safety is at risk if a triage nurse isn't competent in their role
- Nursing shortage and high turnover have forced hospitals to rush novice nurses into the role of triage nurse and constantly reassign the position
- Currently, there is not a standard of practice in the hospital for evaluating triage nurse competency

REVIEW OF LITERATURE

- ➤ Reveals the importance of accurate triage, common barriers to safe and effective triage, and the need to evaluate triage nurse competency (Sax, 2023)
- Mis-triage of patients has been shown in multiple studies to directly correlate with increased mortality rates, increased risk of patient safety, delayed care, increased length of patient stay, and increased costs (Sax, 2023)

PROJECT DESCRIPTION

CHANGE AGENT

Nurse Educator

GOALS & OBJECTIVES

To decrease rates of undertriage and overtriage

Nurses will pass a triage competency test after training and education

PROCESS FOR IMPLEMENTING CHANGE Analyze collected data on current triage accuracy

Present data to management and propose project for change

Create a competency assessment test to determine current baseline triage nurse competency

Create a survey to gather nursing opinions on best ways to implement project

Over the next two weeks, nurses will attend training in groups

After the training, another competency assessment test will be offered to evaluate competency and determine whether the training was effective

Collect and analyze triage data after the project for the next two months

EVALUATION OF PROJECT

- The nurse leading the project needs to determine whether the set goals have been achieved
- ➤ Post-tests will display whether nurses are competent after the project is implemented
- ➤ Data should be collected to display the effects of the project, such as the rates of undertriage and overtriage before and after project implementation
- Post-surveys will help improve the project going forward
- ➤ If any unintended outcomes occurred, the project leader must further investigate how they happened and how to address them
